

Basic Laser Cutting - Keychain

Design

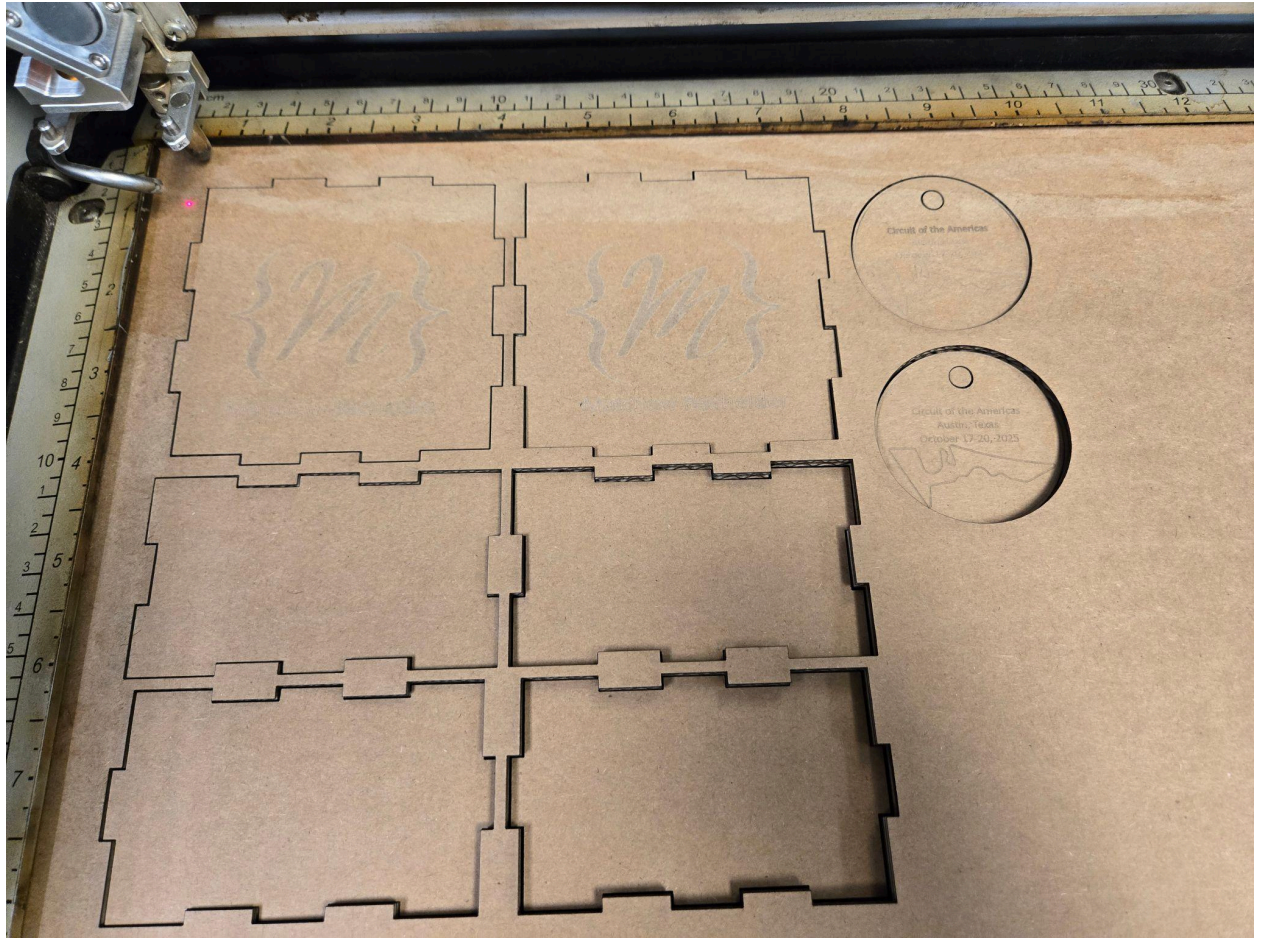

Last weekend (October 17th-20th), I went on a trip with my friend to Austin, Texas, to attend the Formula 1 US Grand Prix at the Circuit of the Americas. I knew I wanted to make the keychain based on that, so I found an open-source SVG of the circuit that I used for the keychain. Then, I added some text, a hole, and an outer ring for extra design. I made the vector cut about a 2-inch diameter, so it's just under the requirements. This worked out extremely well, and it printed nicely on both cardboard and wood. I ended up printing out 2 of them, one for me and one for my friend who went with me. I also ended up printing both the keychain and box together to make it easier on both cardboard and wood, and kept the stack separate.
