

# Basic Laser Cutting - Stacked Slice

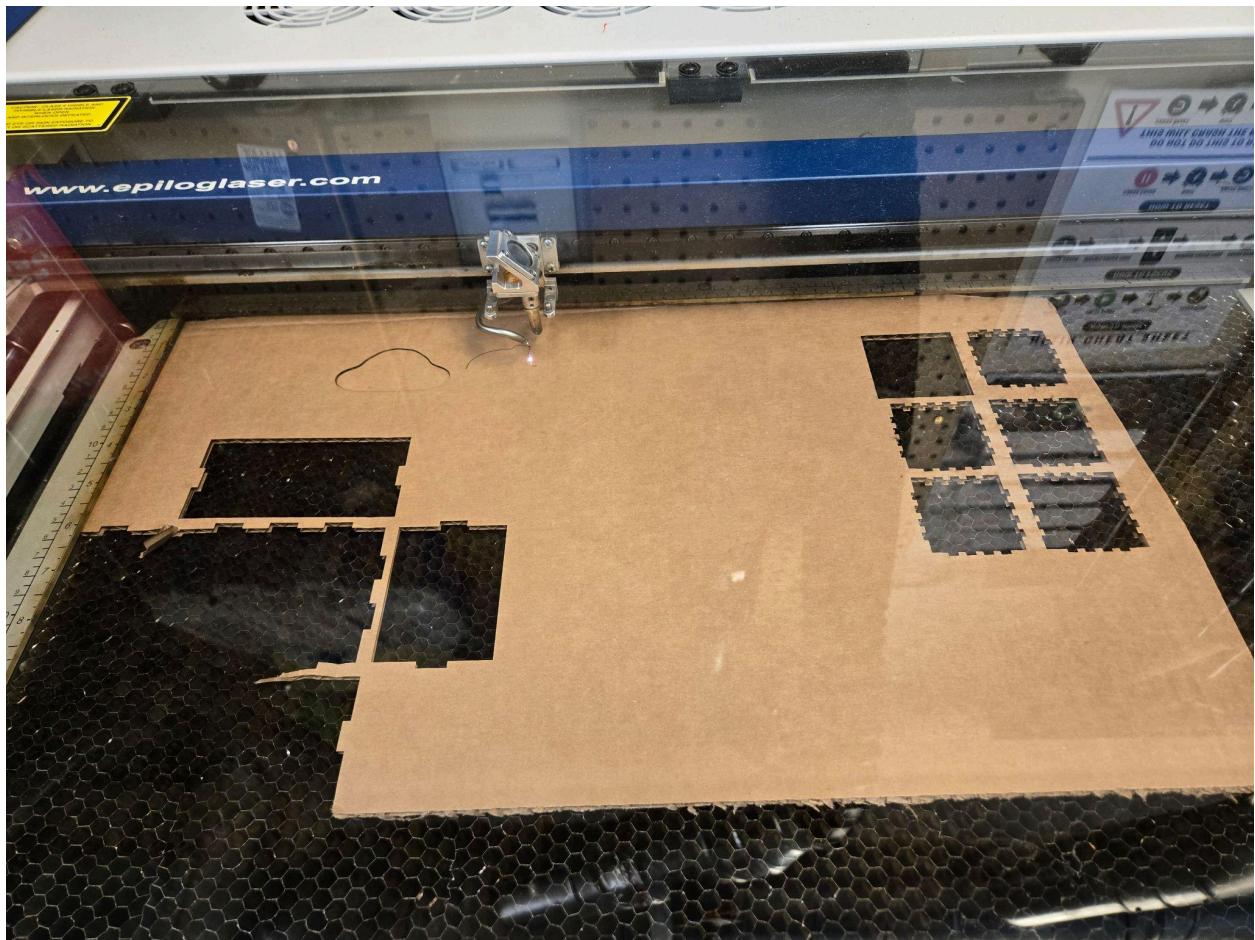

## Design

For this, I chose a random design I found on Thingiverse that fit the bill I was looking for. It has no thin parts or intricate designs, so that made this design a good candidate for this part of the project. After finding a suitable design, I threw it into Kiri:Moto and followed the settings from the canvas page. After getting the SVG, I moved it into a file, changed all the lines to hairline, did some rearranging to fit it in the used cardboard sheet, and printed it out. This process also went very smoothly, and then I took it home to stack.
